

What is Microsoft Office or MS Office?

Microsoft Office or MS Office can be seen as a form of a collection of an array of office-related applications. Each of these Office-related applications has been created by the team of developers at Microsoft to cater to different uses. Microsoft in 2019 launched the latest version of its cloud-based computing platform of MS Office called Microsoft 365. The first suite of MS Office containing various applications was launched in the year 1988, and since then different versions and a total of 16 suites have been released by Microsoft the latest being the MS Office 19 which is for offline use unlike Microsoft 365 which is for online use.

MS Office Overview

Microsoft Office is a **closed-source software** office suite containing different applications.

It was first launched by **Bill Gates** on **19th November 1990** soon after the launch of Microsoft Windows.

The first version of MS Office Contained MS Word, MS Excel & MS Powerpoint. While these are called as the **Applications**, Microsoft Office is called as a **Software**.

Following table provides the list of Applications launched by MS Office:

Application	First Launch	Main Function
MS Word	1983	Creating text files
MS Excel	1985	Creating Spreadsheets
MS Power Point	1990	Creating Presentations
MS Access	1992	Database Management
MS Outlook	—	Emailing & Work Calendar
MS OneNote	2003	Keeping Notes
MS Publisher	1991	Desktop Publishing

Skype	2007	Video Conferencing
-------	------	--------------------

Out of these applications, MS Word, MS Excel & MS Powerpoint are used the most across the world. Let us now have a look at these separately.

MS Office Notes – MS Word

Microsoft Word is the most convenient software used for creating text files. These text files can be edited and transferred from the author to others and edited by them too. This is how word window looks

like:

As a word processing application, there are the following functions available in it:

To **process any commands** on the existing text in Word, first, you need to select the text. To select any text, you need to place the cursor before the word and press Shift+Right arrow. Alternatively, you can place the cursor after the word ends and press Shift+Left Arrow.

From **Home Menu**, you can copy/cut the existing text & paste it to some other place in the same document or in the other document. The other processes that can be performed from 'Home' menu are changing fonts, size, colour, Case, alignment, spacing etc. Bullets & Numbers, Paragraphs can also be introduced from the same menu. You can look for a particular word in the document by clicking on Find from Home menu or simply Pressing Ctrl+F. There is an option of replacing that word too.

From **'Insert' menu**, files apart from text can be inserted in the document. E.g. images, screenshots, tables, links & hyperlinks, charts, shapes, equations, special symbols, headers, footers & page numbers

From **Design menu**, you can obtain pre-decided templates of fonts & font sizes for heading, subheading & other text of the document. That helps improve readability of the file quickly.

Page layout option provides you with a chance to change spacing before the paragraphs, indents and general margin spacing of the page.

From **References** option, you can insert Bibliography & Citation of the texts in different formats like MLA, APA but for that, you need to insert list of books you have referred.

Review option helps you check spelling & grammar errors in the document & protect the document from being edited by non-trusted users.

Now that we have looked at basics of MS Word, now let us move on to MS Excel.

MS Office Notes – MS Excel

MS Excel is used for processing the data that is in tabular form and then perform mathematical functions on it in order to analyze it. This is what Excel window looks like:

MS Excel performs following basic functions:

In MS Excel, there are rows and columns. Intersection of rows and columns forms a cell. So each of the cells is an individual unit of data. Each cell has a cell address which is the number of row and alphabet of the column it appears in. No two cells have the same address ever.

Home & Insert menu of MS Excel is similar to MS Word. You can change the formatting of the content from home & include pie charts, tables and other files related to data from insert menu.

The unique functions that MS Excel has are **Formulas & Data**. You can perform the formula on data in order to analyze it quickly. You have to select the cells for that and one cell becomes one unit of data. So if you select 10 cells and apply an average formula to them, you will get an average of data put in those 10 cells.

To apply a formula to any data, you need to select it without any space. Then in the function bar, you need to type '=' and the abbreviation of the formula you wish to apply.

From Data menu, you can perform functions without changing the original data. You can **filter & sort data** without changing it. Eg. You can sort the data in alphabetical order.

Right from basic functions like **addition & subtraction**, you can perform **complex statistical functions** like correlation & t-test. Moreover, you can convert them into Pie charts or graphs within moments. This makes data analysis easy.

MS Office Notes – MS Powerpoint

MS Powerpoint is an application which provides you slides and run a slideshow.

Firstly, In Powerpoint, there are slides. You need to add content to them to make presentation. From **Home menu**, you can add new slides, decide their sequence, layout, design & other word processing functions like font change, size change etc.

From **Insert menu**, you can add media to the slides to enhance your presentation.

Design menu offers you with ready-made templates & background designs for slides that make the presentation look very attractive.

Transition & Animation are the unique functions of Powerpoint. These menus offer different options in which the text appears on the slides & transition from one slide to other.

Finally, From **Slideshow** menu, you can view the final form of the slideshow. You can start the slideshow from the first slide or the slide that you are editing. Also, You can also set display time for each slide from 'Slideshow' menu.

Other Important Microsoft Functions

MS Office – Microsoft Outlook

i)The MS Outlook application is a Personal Information Manager or in simple words, it is a form of a personal organizer like managing dates, tasks and others.

ii)Its primary work though is to send and receive emails. Outlook came into existence in the year 1997 and was launched as a part of Microsoft Office Suite of 1997.

Note: MS Outlook is an application one needs to pay for to use while creating an email on outlook is free of cost.

MS Office – Microsoft Publisher

i)Microsoft Publisher is a Desktop Publishing Application and works as an entry-level Graphic Design application.

ii)Though on the onset it may seem similar to MS Word it has a greater emphasis on Page layout and Design. It can be used to create basic templates, cover pages and logo designs.

iii)The first version of Microsoft Publisher 1.0 was released in 1991. The file extension of files created by using Microsoft Publisher is .pub.

MS Office – Microsoft Access

i)Microsoft Access functions as a Database Management System (DBMS). It helps users to be able to analyze humongous amounts of information and manage data in a more efficient way.

ii)The application works through storing information which is related together and creates connections between different things to make a holistic and more easy-to-use database.

iii)It is an important application used for Data-entry by organizations. The first version of Access was released by Microsoft Corporation on 13th November 1992.

iv)There are a number of file extensions depending on the file formats, the most common being the .adn extension.

MS Office – Skype

- i) Skype is one of the most used applications for the purpose of telecommunications between computers through Video Chats and Voice Calls between Computers, Tablets, Mobiles and even through devices like Xbox One.
- ii) The application also supports the exchange of messages between the respondents and also can be used for the purposes of Video conferencing.
- iii) Originally founded in 2003 by Niklas Zennstrom from Sweden and Janus Friis from Denmark.
- iv) It was on the 29th of August, 2003 when the first Beta version of Skype went public. Microsoft Corporation would go on to acquire Skype Communications for a sum of \$8.5 Billion in 2011.

Start MS-Word

There are two methods of starting MS-Word which are as follows

- (i) Click on Start button and type run on text box than click on Run after that Run dialog box will be appear on screen. Now type winword on text box and press Enter.
- (ii) Click Start button → All Programs → Microsoft Office → Microsoft Office Word 2007.

It opens MS-Word with a blank document. By default, the name of the blank document is Document1.docx, where .docx is the extension of a MS-Word file.

Components of Microsoft Word

The components of MS-Word are as follows

- (i) **Title Bar** It shows the name of the application and name of the file. It consists of three buttons, i.e.
 - (a) Minimize (reduces the window but Word still active)
 - (b) Restore (brings Word window to the maximum original size)
 - (c) Close (brings us out of Word)
- (ii) **Standard Tool Bar** It displays the symbol for the common operation like Open, Print, Save, etc.
- (iii) **Ribbon** It is a set of tools and commands across the top of the screen. It consists of a panel of commands which are organised into a set of tabs.
- (iv) **Tab** On the ribbon, it contains the buttons needed to edit characters, text and layout.
 - (a) **Home tab** consists of Clipboard (Cut, Copy, Paste), Font (Size, Color Bold, Italic/Underline), Paragraph (Bullets/Numbering, Indent), Styles, Editing (Find and Replace).
 - (b) **Insert tab** consists of Pages (Cover Page, Blank Page, Page Break), Illustrations (Picture, ClipArt, Shapes, SmartArt, Chart), Links (Hyperlink), Header & Footer. Text (Textbox, Date & Time, Object).
 - (c) **Page Layout tab** consists of Themes, Page Setup, Page Background, Paragraph.
 - (d) **Review tab** consists of Spelling & Grammar, Thesaurus, Translate, Compare and Protect Document.
 - (e) **View tab** consists of Print Layout, Full Screen Reading, Macros, Split, etc.

(v) **Ruler** It appears on the top of the document window. It allows to format the horizontal or vertical alignment of text in a document.

There are two types of rulers

(a) **Horizontal ruler** indicates the width of the document and is used to set left and right margins.

(b) **Vertical ruler** indicates the height of the document and is used to set top and bottom margins.

(vi) **Status Bar** It displays the information such as page number, current page, current template, column number and line number, etc.

(vii) **Work Area** It is the rectangular area of the document window, you use to type the text. It is also called as workplace.

(viii) **Cursor** It is also called insertion pointer. It denotes the place where text, graphics or any other item would be placed when you type, overwrite or insert them.

Features of Microsoft Word

MS-Word is the most popular Word processing application due to its user-friendly features as described below

(i) **Text Editing** It provides tremendous flexibility in terms of editing, adding and deleting text, modification of text content, i.e. cut, copy and paste. When, we cut any text in our document, it will save in hard drive temporarily, till we paste it on any other place.

(ii) **Format Text** It offers to modify the text in any of the available hundreds of text designs, format text in various styles such as bold, italic, underline, etc.

- (iii) **Indentation** It denotes the distance text boundaries and page margins. It offers three types of indentation- positive, hanging and negative indent.
- (iv) **Page Orientation** It facilitates selection of typed text printed or visible in horizontal view or vertical view on a specified size of the page. Word offers Portrait- vertically oriented and Landscape- horizontally oriented.
- (v) **Find and Replace** This feature allows flexibility and comfort to the user to replace a text with a substituted text at all places.
- (vi) **Spell Check** This facilitates automatic and manual checking of spelling mistakes and also suggests a few possible alternate options for incorrect spelt words.
- (vii) **Thesaurus** It contains a comprehensive dictionary and thesaurus feature offers synonym options for a word.
- (viii) **Bullets and Numbering** A list of bullets and numbering features used for tables, lists, pages and tables of content. Bullets are arranged in unordered lists and numbering are arranged in ordered lists.
- (ix) **Mail-Merge** Word provides a mail-merge of addresses of a large number of recipients with a common text document.
- (x) **Graphics** It provides the facility of incorporating drawings in the documents which enhances their usefulness.
- (xi) **Object Linking and Embedding (OLE)** It is a program integration technology that is used to share information between programs through objects. Objects save entities like charts, equations, video clips, audio clips, pictures, etc.
- (xii) **Horizontal and Vertical Scroll Bars** They enable one to move up and down or left and right across the window. The horizontal scroll bar is located above the status bar to back and forth the document. The vertical scroll bar is located along the right side of the screen to move up and down the document.

Tit-Bits

MS-Word first released in 1983 under the Name Multi-Tool Word for Xenix Systems.

File format of MS-Word is, doc and .docx.

In MS-Word, a default alignment for paragraph is left.

MS-Word default name is Document 1.

Shortcut Keys of MS-Word and their Descriptions

Standard Toolbar

Tool Name	Shortcut	Description
New	Ctrl + N	Creates a new document.
Open	Ctrl+O or Ctrl 4-F12	Opens an existing document.
	Alt + Ctrl + F2	Opens new document.
Save	Ctrl+S or Shift + F12	Saves the active document.
	F12	Save As

Select	Ctrl + A	Selects all contents of the page.
Print	Ctrl + P or Ctrl + Shift + F12	Prints the active document.
Print Preview	Ctrl+F2	Displays full pages as they are printed.
Spelling	F7	Checks the spelling in the active document.
Find, Replace & Goto	F5	Open the find, replace and go to window.
Cut	Ctrl + X	Cuts the selection and puts it on the clipboard.
Copy	Ctrl + C	Copies the selection and puts on the clipboard.
Paste	Ctrl + V or Shift 4- Insert	Inserts the clipboard contents at the insertion point.
Format Painter	Ctrl + Shift + C	Copies the formatting of the selection to a specified location.
Undo	Ctrl + Z	Reverse certain commands.
Redo	Ctrl + Y	Reverse the action of the Undo button.
Help	F1	Provides the help for working on MS -Word.
Find	Ctrl+F	Opens find box.
Insert	Ctrl+K	Inserts link.
Delete	Ctrl + Del	Deletes word to right of cursor.
	Ctrl + Backspace	Deletes word to left of cursor.
Insert	Alt + Shift + D	Insert the current date.
	Alt + Shift + T	Insert the current time.

Formatting Toolbar

Tool Name	Shortcut	Description
Style	Ctrl + Shift 4- S	Applies a style or records a style by example.
Font	Ctrl + Shift + F	Changes the font of the selection
Font Size	Ctrl + Shift + P	Changes the font size of the selections.
Bold	Ctrl + B	Makes the selection bold.

Italic	Ctrl + I	Makes the selection italic.
Underline	Ctrl + U	Formats the selection with continuous underline.
Aligned Left	Ctrl + L	Aligns the paragraph at left indent. (By default)
Centre	Ctrl + E	Centres the paragraphs between the indents.
Aligned Right	Ctrl + R	Aligns the paragraph at right indent.
Justify	Ctrl + J	Aligns the paragraph at both right and left indent.

Microsoft Excel

An electronic spreadsheet is used for analysing, sharing and managing information for accounting purpose performing mathematical calculations, budgeting, billing, etc. A spreadsheet is a matrix of rows and columns similar to an accounting ledger. The spreadsheet program also provides tools for creating graphs, inserting pictures and chart, analysing the data, etc. Microsoft Excel (MS-Excel), Corel Quattro Pro, Snowball, Lotus-1-2-3, Apple Numbers are some of the spreadsheet software.

Start MS-Excel

To start MS-Excel software, we can follow any one method out of them

(i) Click on Start button and type run on text box than click on Run after that Run dialog box will be appear on screen. Now type winword on text box and press Enter.

(ii) Click Start button → All Programs → Microsoft Office → Microsoft Office Excel 2007

Components of Microsoft Excel

The components of MS-Excel are as follows

(i) **Title Bar** It shows the name of the application and name of the file. It consists of three buttons, i.e. minimize, maximize and close.

(ii) **Ribbon** It consists of a panel of commands which are organised into a set of tabs.

(iii) **Tabs** It contains the command such as Home, Insert, Page Layout, Formulas, Data, Review, View, etc as well as any additional command that you may need.

Some commands are as follows

(a) **Clipboard** A clipboard group contains the Cut, Copy and paste commands.

(b) **Alignment** It is used to change alignment of the text in the cells - vertical alignment, horizontal alignment, indentation, wrap the text, shrink it to fit within the cell and merge multiple cells.

(c) **Table** It is used to define a range of cell as a table for easy filtering and sorting and create a pivot table or chart to arrange and summarise the data.

(d) **Function Library** It contains a library of functions (e.g. mathematical, logical, trigonometric, etc), such as AND, IF, LOOKUP, AVG, DATE, etc.

(e) **Macros** It is used to define a sequence of actions to perform on a document or multiple documents that can be executed again and again.

(iv) **Status Bar** It displays information about the currently active worksheet. It includes page number, view shortcuts, zoom slider, etc.

(v) **Formula Bar** It is located beneath the Ribbon. It is used to enter and edit worksheet data.

It includes

(a) Name box displays the all reference or column and row location of the active cell.

(b) Functions are predefined formulas that perform calculations by using specific values, called arguments.

Predefined formulas in MS-Excel are called functions.

There are different types of functions

Function	Description	Example
SUM	It is used to add all the values provided as argument	= SUM (A1 : A5)
AVERAGE	This function calculates the average of all the values provided as argument	= AVERAGE (A1 : A5)
COUNT	This function counts the number of cells that contain number	=COUNT (A1 : A5)
MAX	This function is used to return maximum value from a list of arguments	=MAX (A1 : A5)
MIN	This function is used to return minimum value from a list of arguments	=MIN (A1: A5)

Where A1: A5 is a range between the cells of A1 and A5.

Basics of Spreadsheet

MS-Excel allows creation of spreadsheets.

The basic terms of spreadsheet are

(a) A spreadsheet is a software tool that lets one enter, calculate, manipulate and analyse set of numbers.

(b) The intersection of each row and column is called cell. A cell is an individual container for data.

It may hold

Numbers (Constants)

Formulas (Mathematical equations)

Text (Labels)

(c) An array of cells is called a sheet or worksheet. A worksheet holds information presented in tabular format with text that labels the data.

(d) A -workbook is a document that contains one or more worksheet.

(e) A row is given a number that identifies it, starts from 1, 2, 3, 4, 5, ... so on.

(f) A column is given a letter that identifies it, starts from A ... Z, AA ... AZ, BA, BB ... BZ so on.

(g) A cell pointer is a cell-boundary that specifies which cell is active at that moment.

(h) A formula is an equation that calculates the value to be displayed. A formula must begin with equal to (=) sign.

(i) A cell address is used to specified the intersecting of row and column of the letter and number on worksheet.

Charts

These are the graphical and pictorial representation of worksheet data. A chart consists of following components

- (i) X-Axis is a horizontal axis known as category axis.
- (ii) Y-Axis is a vertical axis known as values axis.
- (iii) Data series is the set of values that you want to plot in the chart.

Types of Charts

There are various types of charts.

- (a) Area Chart It emphasises the magnitude of change over time.
- (b) Column Chart It shows data changes over a period of time or illustrates comparisons among items.
- (c) Bar Chart It illustrates comparisons among individual items. Categories are organised vertically and values horizontally.
- (d) Line Chart It shows trends in data at equal intervals. It is useful for depicting the change in a value over period of time.
- (e) Pie Chart It shows the proportional size of items that make up only one data series to the sum of the items.
- (f) XY (Scatter) Chart It shows the relationships among the numeric values in several data series or plots two groups of numbers as series of XY coordinates.

Components of a Chart

- (a) **Chart Area** This is the total region surrounding the chart.
- (b) **Plot Area** The area where data is plotted. The plot area is bounded by axes in a 2D-Chart where as in 3D-Chart it is bounded by walls and floor.
- (c) **Chart Title** The descriptive text aimed at helping user identify the chart.
- Axis Title** These are the titles given to three axis, i.e. X, Y, Z.
- (d) **Data Series** A row or column of numbers that are plotted in a chart is called a data series.
- (e) **Gridlines** These are horizontal and vertical lines which inserted in the chart to enhance its readability.
- (f) **Legends** It helps to identify various plotted data series.
- (g) **Data Label** It provides additional information about a data marker.
- (h) **Data Table** It is defined as a range of cells that are used for testing and analysing outcomes on a large scale.

Tit -Bits

in Excel, each **new workbook** has created three worksheets by default.

Active cell is a cell in which you are currently working.

File format or extension of Excel is .xlsx or .

\$ sign locks the cells location to a fixed position,

Stacked Bar Column, shows the relationship of individual items to the whole.

Scatter compares pairs of values.

Chart wizard is used to create charts in MS-Excel

Embedded chart is a. chart that is drawn on an existing sheet.

Shortcut Keys of MS-Excel and their Descriptions

Shortcut Keys	Description
F2	Edit the selected cell.
F5	Go to a specific cell. e.g. C6
F7	Spell check selected text and/or document.
F11	Create chart.
Ctrl + Shift + ;	Enter the current time.
Ctrl + ;	Enter the current date.
Alt + Shift+F1	Insert new worksheet.
Shift+F3	Open the Excel formula window.
Shift+F5	Bring up search box.
Ctrl +A	Select all contents of the worksheet.
Ctrl+B	Bold highlighted selection.
Ctrl +I	Italic highlighted selection.
Ctrl + K	Insert link.
Ctrl + U	Underline highlighted selection.
Ctrl + P	Bring up the Print dialog box to begin printing.
Ctrl + Z	Undo last action.
Ctrl + F9	Minimise current workbook.
Ctrl+F10	Maximise currently selected workbook.
Ctrl+F6	Switch between open workbooks/ windows.
Ctrl + Page up	Move between Excel worksheets in the same Excel document.

Ctrl + Page down	Move between Excel worksheets in the same Excel document.
Ctrl + Tab	Move between two or more open Excel files.
Alt + =	Create a formula to sum all of the above cells.
Ctrl+'	Insert the value of the above cell into cell currently selected.
Ctrl + Shift +!	Format number in comma format.
Ctrl + Shift + \$	Format number in currency format.
Ctrl + Shift + #	Format number in date format.
Ctrl + Shift + %	Format number in percentage format.
Ctrl + Shift + @	Format number in time format.
Ctrl + Space	Select entire column.
Shift + Space	Select entire row.

Microsoft PowerPoint

The application software that can create professional looking visual aids is called presentation graphics software. The presentation software is used for creation of the slides and to display the information in the form of presentation of slides. A presentation software provides tools like editor that allows insertion and formatting of text and methods for inserting and manipulating graphics images along with sound and visuals effect.

Start MS-PowerPoint

To start the MS-PowerPoint software, we need to

Click Start button → All Programs → Microsoft Office → Microsoft Office PowerPoint 2007

Components of PowerPoint

Various components of MS-PowerPoint 2007 window are described below

- (i) **Title Bar** It contains the name of currently opened file followed by software name.
- (ii) **Ribbon** It is same as Word and Excel, just few tabs are different like Animations, Slide Show. etc.
- (iii) **Slide** It appears in the centre of the window. You can create your presentation by adding content to the slides.
- (iv) **Slide Pane** This area of PowerPoint window displays all the slides that are added in the presentation.
- (v) **Slides View Tab** This tab displays a thumbnail view of all the slides.
- (v) **Outline View Tab** This tab displays the text contained in the presentation in an outline format.
- (vii) **Notes Section** This can be used for creating notes.
- (viii) **Status Bar** It displays the number of the slide that is currently being displayed.

PowerPoint Views

Different types of views available in PowerPoint 2007 are explained below

(i) Normal View This is the main editing view, where you write and design your presentations, i.e. actual screen which is displayed.

(ii) Slide Sorter View It provides a view of slides in thumbnail form. This view makes it easy to sort and organise the sequence of the slides at the time of creating presentation and also, at the time of preparing presentation for printing.

(iii) Notes Page View In the Notes Page view, the notes pane is located just below the slide pane. Here, notes that apply to the current slide can be typed. Later, these notes can be printed and referred while giving actual presentation.

Notes can also be printed to handout to the audience or included in a presentation that is delivered to the audience or posted on a Web page. When it is required to view and work with notes in full page format on the view tab in the Presentation views-group, click notes pay,

(iv) Slide Show View This is used to deliver a presentation to the audience. Slide Show view takes up the full computer screen, like an actual presentation. In this view, you can see your presentation, the way audience wants. This view enables you to see how graphics, timings, movies, animated effects and transition effects will look during the actual presentation. To exit Slide Show view, press Esc key from the keyboard.

(v) Master View The Master views include Slide view, Handout view and Notes view They are the main slides that store information about the presentation, including background color, fonts effects, placeholder sizes and positions.

File format for the documents created is, pptx or ppt

Trigger is defined as an object or item that performs on the slide when we click the mouse.

The MS-PowerPoint can maximum zoom to 400% only.

In MS-PowerPoint, we can add many types of image and sound format such as .git, .bmp, .png, .jpg, .gif, .wav, .mid, etc,

Shortcut Keys of Microsoft PowerPoint and their Descriptions

Shortcut Keys	Description
F5	View the Slide Show.
Shift + Ctrl + Home	Selects all text from the cursor to the start of the active text box.
Shift + Ctrl + End	Selects all text from the cursor to the end of the active text box.
Spacebar or Click the mouse	Move to next slide or next animation.
S	Stop the show press S again to restart the show.
Esc	End the slide show.
Shortcut Keys	Description
Ctrl + A	Select all items on the page or the active text box.
Ctrl + B	Applies bold to the selected text.

Ctrl +- D	Duplicates the selected object.
Ctrl + F	Opens the Find dialog box.
Ctrl + G	Opens the Grids and Guides dialog box.
Ctrl + H	Opens the Replace dialog box.
Ctrl + I	Applies Italics to the selected text.
Ctrl + M	Inserts a new slide.
Ctrl+N	Opens a new blank presentations.
Ctrl+O	Opens the open dialog box.
Ctrl + T	Opens the Font dialog box.
Ctrl+U	Applies underlining to the selected text.
Ctrl+V	Paste
Ctrl + W	Closes the presentation.
Ctrl+Y	Repeats the last command entered.
Home	Move cursor to beginning of current line of text.
End	Moves cursor to end of current line of text.
Ctrl + Home	Moves cursor in beginning of presentations.
Ctrl + End	Moves cursor to end of presentation.
Shift + Click each side	Select more than one slide in a presentation.
Shift + El	Help

Microsoft Access

A database is a collection of logically related and similar data. Database stores similar kind of data for a specific purpose that is organised in such a manner that any information can be derived from it, when needed. Microsoft Access is an application which allows the creating of databases. Microsoft Access is a Relational Database anagement System (RDBMS). Access is a tool for managing the database. It allows you to design and create complete databases with quick and easy data entry, maintain them and search for information.

Start MS-Access

To start the MS-Access software, we need to

Click Start button → All Programs → Microsoft Office → Microsoft Office Access 2007

Components of MS-Access

Within MS-Access there are four components

- (i) **Table** It stores the data in your database.
- (ii) **Queries** get information from the data stored in the tables.

There are five types of queries

Query Type	Description
Select query	Retrieves data from one or more tables and displays the recordset in a datasheet. This is the most common type of query.
Parameter query	Prompts the user to enter values that define the query, such as a specified region for sales results or a specified price range for houses.
Cross-tab query	Arranges a recordset to make it more easily visible, using both row headings and column headings.
Action query	Creates a new table or changes an existing table.
SQL query	An advanced query that is created by using an SQL statement.

- (iii) **Reports** allow printing of data, based on queries or tables created by the user.
- (iv) **Forms** make it easy to enter data in the tables. A form is an interface for adding and editing data.

MS-Access Templates

It is a complete tracking application with predefined tables, forms, reports, queries, macros and relationships. MS-Access includes a collection of database templates, which are described as

- (i) **Assets** It is used to create an assets database to keep track of assets, including assets details and owners.
- (ii) **Contacts** It is used to create a contact database to manage information about people.
- (iii) **Events** It is used to create an events database for tracking upcoming meeting, dealings, etc.
- (iv) **Faculty** It is used to create a faculty database to keep track of information about contacts and education history.
- (v) **Marketing Projects** It is used to create a marketing projects database to track time-sensitive deliverable and vendor status for project.

(vi) Students It is used to create students database to keep information about your students including contacts, about their guardians.

Elements of MS-Access

In MS-Access, database holds five major elements for every database operation

(i) Field Name It is a label provided for a field that specifies the type of information contained in a particular field.

(ii) Field Type/Data Type It specifies the type of data stored in the field such as textual data and numerical data or combination of both. The default size of data type is 50 in MS-Access.

Data Type	Field length or Field size
Text	0-255 characters
Memo	0-65535 characters
Number	1, 2, 4 or 8 bytes
Date/Time	8 bytes
Currency	8 bytes
Auto Number	4 bytes
Yes/No	1 bit (0 or 1)
OLE object	up to 1 GB
Hyperlink	Each part contains 2048 characters

(iii) Field Length Field refers length or width to the maximum number of characters that a field can contain.

(iv) Primary Key A field which is used to uniquely identify the records in a table. The primary key cannot contain null value.

(v) Validation Rule It is a condition that must be met before data is accepted into database.

(vi) MS-Access View You can create a table by two most popular ways

(a) Datasheet View It shows the data in the database and also allows you to enter and edit the data but not allow to change the database.

(b) Design View It allows you to create or change the table and also set the keys.

(vii) Filtering Data It enables to display only those records in a table that meet a specified filter criterion.
